

Dairy Technology – *Optimize Plus* (More milk from forage)

For high-yielding herds, the demand for silage that enhances intakes, maximizes palatability and maintains yield levels is greater than ever. Lancashire farmers James and Anne Rogerson also found maintaining milk quality and body condition a challenge for their 260 cows. The problem is making silage nutrients available in the rumen. However the solution they use is simple: EnviroSystems' silage inoculant *Optimize Plus*.

By combining beneficial bacteria *Bacillus Subtilis* and *B-Pumilus*, *Optimize Plus* raises energy and protein availability to rumen microbes. Fewer mycotoxin-producing "spoilage organisms" sit inside the clamp, silage digestibility improves, not to mention the extra 1MJ ME/kg of Dry Matter provided by the enzyme treatment.
