

Mecmar – Attention to Detail is Critical

Mecmar has manufactured mobile grain driers since 1984. The Mecmar grain drier has evolved continually based on feedback from farmers across Europe. The design of today's Mecmar drier is based upon years of innovation and attention to detail. This has resulted in a drier of industrial specification that delivers a high level of performance, reliability and durability. This attention to detail may be seen in every aspect of the Mecmar drier.

Take the critical function of crop recirculation. Good crop recirculation ensures a high hourly throughput, homogeneous drying and safety during the drying process. The higher the moisture content of a crop the more resistant it becomes to circulation. When drying crops with a high moisture content maintaining a high level of drier performance, reliability and durability is of paramount importance to the farmer.

In the Mecmar grain drier there are many small design features that promote good crop recirculation. The steep bottom cone, complete with solid stainless steel screens reduce resistance to flow. The variable pitch central auger ensures against the auger blocking. The large diameter gear on the agitator drive gives a high transmission ratio providing the torque required for the agitator to effectively stir the crop. The central augers substantial flight thickness and reinforced outer edges ensures the augers ability to recirculate the crop over a long service life.

All these small yet highly significant design elements exist throughout the Mecmar drier. They are directly a result of many years of trial and improvement by Mecmar delivering the highest quality product to the farmer.
