FAN SPEED CONTROL

Octagon Products have the ability to control the speed of fans and electric motors from their grain storage p.c. control system. Not only being able to select speeds at which the customer would like the fan to run, the system can control the motor speed, according to temperature or humidity within the drying or storage system.

Within the grain drying programs the store manager can dry grain at full or at a selected speed, with either duct humidity or duct temperature. When stirring reduce the speed to maximize energy efficiency and minimize gas usage.

When cooling slow the fan down to cool at a reasonable rate.

The use of the inverter minimizes starting loads and maximizes motor life

The p.c. can be integrated with a propriety energy meter to cost individual stores.
